RQCB - Kick-down, pilot-operated, balanced piston relief valve
RVCB - Normally closed modulating element valve with relief function

The example shows an alternative to a kick-down relief valve that typically causes pressure spikes in the tank line.

- Kickdown relief valve: RQ*B
- Pilot-operated vented relief valve: RV**

Benefits of this circuit arrangement

- Kickdown relief valves open rapidly and stay open when supply pressure exceeds the setting of the valve. The rapid opening could cause pressure spikes in the tank line.
- An RQ** can be used to pilot operate a vented relief valve RV**. The circuit in Fig.2 can replace the kick-

down relief in **Fig.1**. Since the pilot kick down RQ**unloads the RV** downstream, it unloads less rapidly (due to a damping orifice within the RV**).
